

# Axiom Clinical Analytics

Improve clinical outcomes, optimize revenues, and reduce costs with a single source of truth

As hospitals and health systems face increasing pressures to improve quality of care while managing costs, the demand for sound, data-driven decision-making has never been higher. **Axiom™ Clinical Analytics** is a robust platform that helps organizations evaluate performance at all levels by tying cost savings to quality-of-care metrics. It empowers healthcare leaders to identify best practices and quantify preventable complications, readmissions, and safety events, and find the quickest path to reduce unintended clinical variation.

## Key capabilities include:

- **Interactive, customizable scorecards**, aligned with key metrics, allow for “slicing and dicing” across normalized, disparate sources of data including patient billing, electronic health records, core measures, patient satisfaction (CMS HCAHPS data), clinical registries, and more to gain a deeper understanding of clinical quality improvement opportunities.
- **Performance evaluation and reporting** at the system, hospital, service line, clinical unit, physician, and patient levels for the C-suite to align strategic imperatives.
- **Gold standard benchmarks** at the national, regional, state, and hospital level, plus customizable internal and external benchmarks.
- **Full engagement of physicians** in understanding their own performance through an enhanced user experience and balanced, detailed reports. Axiom Clinical Analytics supports both the Ongoing Professional Practice Evaluation (OPPE) and Focused Professional Practice Evaluation (FPPE) processes.

## Improve Clinical Outcomes

### Reduce Variations in Care

A single source of truth that aggregates and normalizes disparate sources of data, including patient billing, cost detail, electronic health record data, patient satisfaction data, core measures, and clinical registries (i.e. NHSN). Users can drill down into patient-level data to perform root-cause analysis and identify improvement opportunities.

### Benchmark performance

Unbiased comparisons with gold standard benchmarks at the national, regional, state, and hospital level – based on one of the largest public data sets (including National and All-Payor data) that captures two out of three encounters across the U.S. Create customized internal and external benchmarks to easily monitor and track performance against peers on an ongoing basis and drive performance improvement initiatives.

### Engage clinicians

Fully streamlined, electronic PPE reporting and automated workflow process supports physician profiling and allows for a comprehensive view of care quality across the organization, supporting both the Ongoing Professional Practice Evaluation (OPPE) and Focused Professional Practice Evaluation (FPPE) processes.

Create individual physician and physician group-based reports reflecting patient safety, quality, patient satisfaction, utilization, costs, and other specific measures.

Custom physician reports can be created, distributed, and viewed within the application. Extensive and user-customizable workflow features allow for scheduling, routing, annotation, and electronic signature of physician performance reports.

With a comprehensive view of physician performance and tools to engage physicians, organizations can identify areas of greatest opportunity and guide improvement initiatives.

## Optimize revenue

### Maximize reimbursement

Successfully engage in "at-risk" programs and achieve specified goals (i.e. increased reimbursement) with tools to aggregate, analyze, and monitor key cost and quality metrics that ensure healthcare organizations can maximize reimbursement.

## Improve patient satisfaction

Get a comprehensive view of the organization's operational data (including utilization data) tied to satisfaction metrics. The powerful analysis tools embedded in Axiom Clinical Analytics allow organizations to track satisfaction data across units and analyze this data by demographics, facility, physician, etc., allowing organizations to identify areas of improvement and take action to meet value-based care goals, increase volume, and optimize revenue.

## Reduce cost

### Understand the financial impact of providing high quality care

By accessing timely and relevant data, organizations can better understand and reduce the financial impact of providing high quality care. Axiom Clinical Analytics offers a single source of truth across both cost and quality data to ensure stakeholders access and review the same normalized and standardized data, allowing for improved decision-making and focus on improvement opportunities.
